

Module 7

Manage your work with GitHub Projects

Agenda

GitHub Foundations Part 1

- 1 Introduction to Git
- 2 Introduction to GitHub
- 3 Introduction to GitHub's products
- 4 Configure code scanning on GitHub
- 5 Introduction to GitHub Copilot
- 6 Code with GitHub Codespaces
- 7 Manage your work with GitHub Projects
- 8 Communicate effectively on GitHub using Markdown

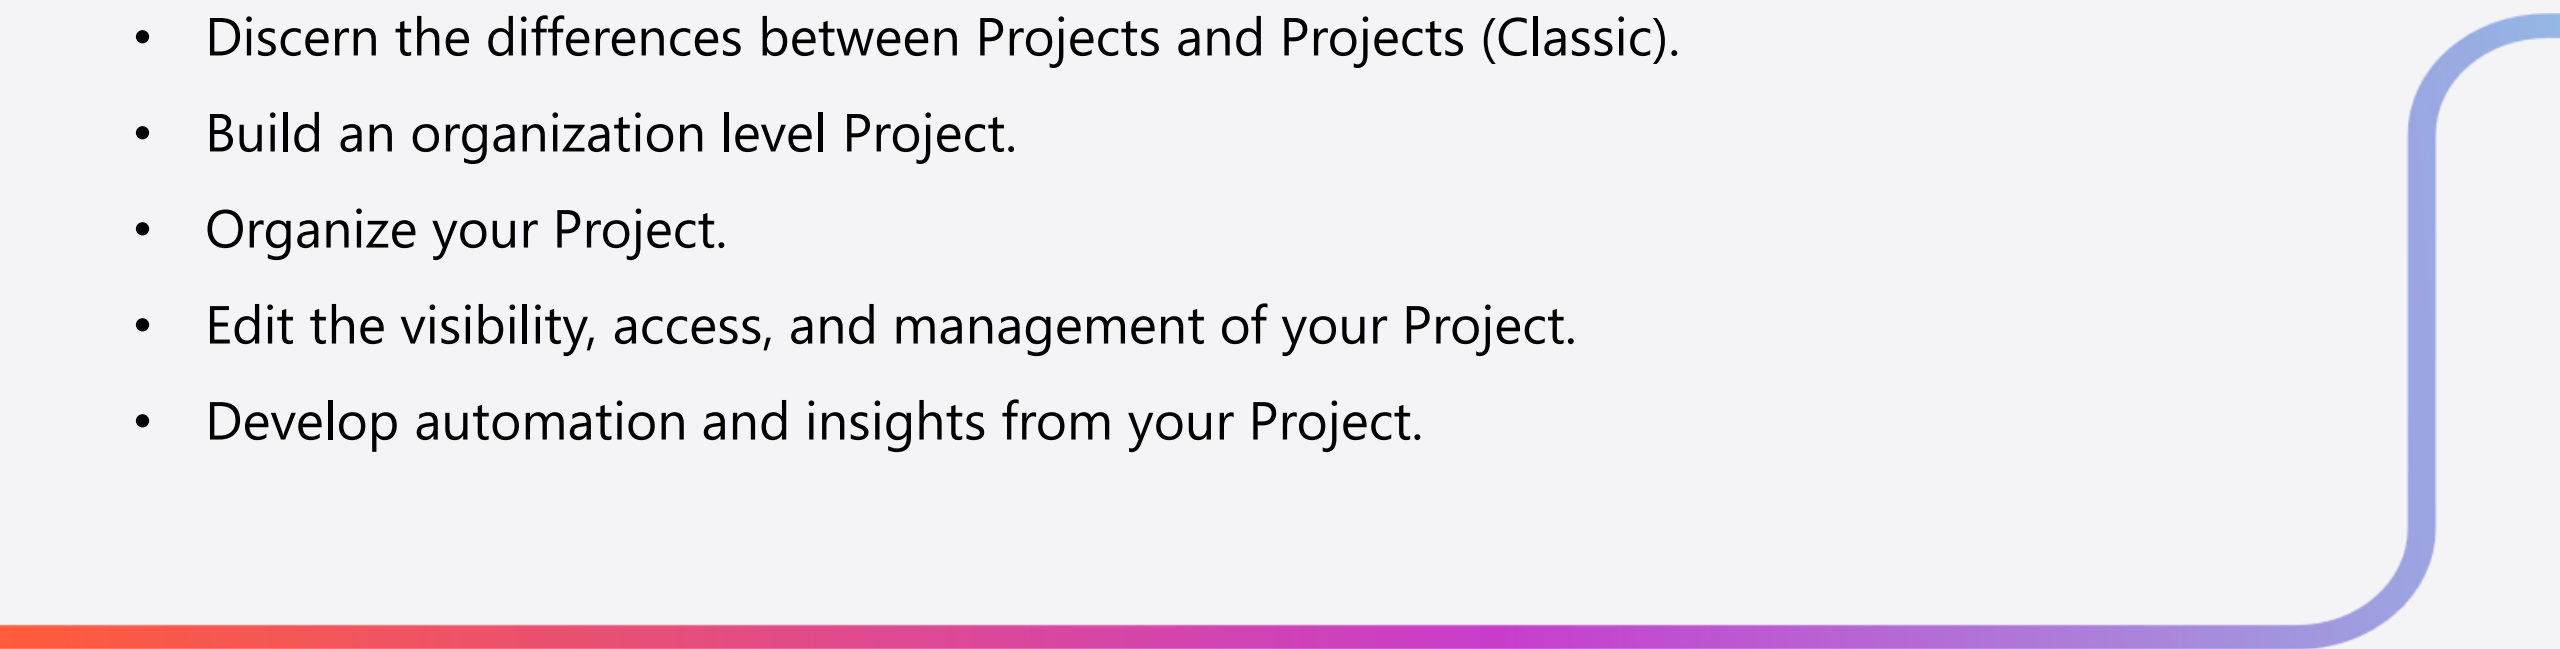

GitHub Foundations Part 2

- 9 Contribute to an open-source project on GitHub
- 10 Manage an InnerSource program by using GitHub
- 11 Maintain a secure repository by using GitHub best practices
- 12 Introduction to GitHub administration
- 13 Authenticate and authorize user identities on GitHub
- 14 Manage repository changes by using pull requests on GitHub
- 15 Search and organize repository history by using GitHub
- 16 Using GitHub Copilot with Python

Introduction

Learn to use GitHub Projects to create issues, break them into tasks, track relationships, add custom fields, and have conversations.

By the end of this module, you'll be able to:

- Discern the differences between Projects and Projects (Classic).
 - Build an organization level Project.
 - Organize your Project.
 - Edit the visibility, access, and management of your Project.
 - Develop automation and insights from your Project.
- 

Projects versus Projects Classic

let's take a moment to walk through what has changed from Projects (Classic).

	Projects	Projects (Classic)
Tables and Boards	Boards, Lists, Timeline Layout	Boards
Data	Sort, rank, and group items by custom fields such as text, number, date, iteration and single select	Columns and Cards
Insights	Create visuals to help understand your work through historical and current charts with Projects	Progress bar
Automation	Use GraphQL API, Actions, and Column presets to manage your Project	Configure Column presets for when issues and pull requests are added, edited, or closed

How to create a project

Creating an Organization-Level Project

- Navigate to your profile photo, select "Your organizations," and choose the organization for your new project.
- Go to the Projects tab and select "New Project," then choose "Start from scratch" and select "Table."
- Click the green "Create project" button to create the project.

Setting Project Name, Description, and README

- Navigate to the newly created project and open the settings menu by selecting the three dots.
- Edit the project name, add a short description, and write a README to explain the project's purpose.
- Save the changes to update the project details.

Adding Issues and Pull Requests

- Add existing issues or pull requests by copying and pasting their URLs into the project.
- Search for existing issues or pull requests by typing "#" and selecting the repository and items.
- Bulk add issues and pull requests by selecting "Add item from repository," choose the repository and items.

Managing Issues and Pull Requests

- Use the "+" button in the project to add items from a repository.
- Change the repository if needed and select the issues or pull requests to add.
- Click the green "Add selected items" button to include the chosen issues and pull requests in the project.

How to organize your project

Creating and Grouping by Priority

- Create a new field in the table view by selecting the "+" button and choosing "New field."
- Name the field "Priority," select "Single select" as the field type, and add priority levels (Urgent, High, Medium, Low).
- Classify issues and pull requests by selecting the priority in the field row, then group them by priority using the "Group by" option.

Adding an Iteration Field

- Add an iteration field by selecting the "+" button in the table view and choosing "New field."
- Name the field (e.g., Project Phase or Sprint), select "Iteration" as the field type, and set the start date and duration.
- Assign iteration phases to issues and pull requests to visualize and organize upcoming work.

Creating a Board View

- Change the layout to "Board" by selecting the down arrow and choosing "Board" under Layout.
- Save the board view and rename it by double-clicking the view's tab.
- Drag and drop issues and pull requests into columns to visually manage tasks.

How to organize your project

Creating and Grouping by Priority

- Create a new field in the table view by selecting the "+" button and choosing "New field."
- Name the field "Priority," select "Single select" as the field type, and add priority levels (Urgent, High, Medium, Low).
- Classify issues and pull requests by selecting the priority in the field row, then group them by priority using the "Group by" option.

Adding an Iteration Field

- Add an iteration field by selecting the "+" button in the table view and choosing "New field."
- Name the field (e.g., Project Phase or Sprint), select "Iteration" as the field type, and set the start date and duration.
- Assign iteration phases to issues and pull requests to visualize and organize upcoming work.

Creating a Board View

- Change the layout to "Board" by selecting the down arrow and choosing "Board" under Layout.
- Save the board view and rename it by double-clicking the view's tab.
- Drag and drop issues and pull requests into columns to visually manage tasks.

How to organize your project

Controlling Project Visibility

- You can set your project to be public or private, determining who can view it.
- To change visibility, navigate to your project, select the three dots in the top-right menu, and choose Settings.
- Scroll to the Danger zone and select Private or Public from the Visibility drop-down.

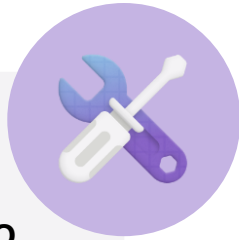

Managing Project Access

- Organization-level projects: Admins can manage access for the entire organization, teams, individual members, and outside collaborators.
- Personal/user-level projects: Admins can invite individual collaborators and manage their access.
- Access levels include No access, Read, Write, and Admin, with varying permissions for viewing, editing, and managing the project.

Inviting Collaborators and Changing Roles

- Navigate to your project, select the three dots in the top-right menu, and choose Settings.
- In the left-hand navigation bar, select Manage access.
- Invite individuals and teams by searching in the Invite collaborators search bar, and change their roles or remove them under Manage access.

Insight and automation with projects

You can create charts to show the number of items assigned to each individual, or the number of issues assigned to each upcoming iteration.

Open any repository, fork, or pull request in GitHub.dev editor.

Insight and automation with projects (cont.)

Historical charts are time-based charts that allow you to view your Project's trends and progress.

View the number of items over time grouped by status and other fields.

The Burn up chart shows item status over time, allowing you to visualize progress and spot patterns.

Summary

In this module, you learned about GitHub Projects. GitHub's project management tool connects your planning directly to the work your teams are doing in GitHub, and flexibly adapts to whatever your team needs at any point.

Now that you've finished this module, you should be able to:

- Build an organization Project
- Automate and organize your Project

End of presentation
