

Module 10

Manage an InnerSource program by using GitHub

Agenda

GitHub Foundations Part 1

- 1 Introduction to Git
- 2 Introduction to GitHub
- 3 Introduction to GitHub's products
- 4 Configure code scanning on GitHub
- 5 Introduction to GitHub Copilot
- 6 Code with GitHub Codespaces
- 7 Manage your work with GitHub Projects
- 8 Communicate effectively on GitHub using Markdown

GitHub Foundations Part 2

- 9 Contribute to an open-source project on GitHub
- 10 Manage an InnerSource program by using GitHub
- 11 Maintain a secure repository by using GitHub best practices
- 12 Introduction to GitHub administration
- 13 Authenticate and authorize user identities on GitHub
- 14 Manage repository changes by using pull requests on GitHub
- 15 Search and organize repository history by using GitHub
- 16 Using GitHub Copilot with Python

Introduction

In this module, learn how to manage a successful InnerSource program on GitHub through effective discoverability, guidance, and maintenance.

By the end of this module, you'll be able to:

- Contrast user- versus organization-owned projects.
 - Make recommendations about the number of GitHub organizations you should have.
 - Create discoverable repositories.
 - Create robust repository READMEs. ✓
 - Use issue and pull-request templates. ✓
 - Distribute your InnerSource toolkit.
- 

How to manage a successful InnerSource program

Why use InnerSource?

- InnerSource applies open-source patterns to projects with a limited audience.
- It creates an open-source-like environment behind a company's firewall for employees.

InnerSource Benefits

- Developers can view and reuse code from other teams, enhancing productivity and understanding project direction.
- Teams can propose changes or fork projects to meet their needs, facilitating collaboration.

Setting Up an InnerSource Program

- Configure repositories as public, internal, or private based on access needs.
- Assign permissions (read, triage, write, maintain, admin) to control access and contributions.

Creating Discoverable Repositories

- Use descriptive names and concise descriptions to make repositories easy to find.
- Include README.md files to communicate project expectations and manage contributions.

Managing Projects on GitHub

- CONTRIBUTING.md: Use this file to explain contribution policies and encourage adherence to project conventions.
- CODEOWNERS: Define individuals or teams responsible for reviewing code modifications.

Creating Issue and Pull Request Templates

- Templates: Provide initial description text for new issues and pull requests to streamline.
- Workflows: Specify workflows for branches, pull requests, and releases for external contributors.

Exercise - InnerSource fundamentals

The InnerSource guide is an expanded checklist of items to include in your GitHub repositories for the following categories:

- Team
- Repository
- Project
- Developers

Summary

In this module, you wanted to take part in the open-source community by learning how to provide support and contribute to open-source projects using GitHub.

You learned about:

- Contrasting user owned projects versus organization owned projects.
 - Making recommendations about the number of GitHub organizations.
 - Creating discoverable repositories.
 - Creating robust repository READMEs.
 - Using templates for issue requests and pull requests.
 - Building transparency into repositories.
 - Distributing your InnerSource toolkit.
- 

End of presentation
